What temperature should a battery be?

The ideal battery temperature for maximizing lifespan and usable capacity is between 15 °C to 35 °C. However, the temperature where the battery can provide most energy is around 45 °C. University research of a single cell shows the impact of temperature on available capacity of a battery in more detail.

Can a lithium battery run at 115 degrees Fahrenheit?

Any battery running at an elevated temperature will exhibit loss of capacity faster than at room temperature. That's why, as with extremely cold temperatures, chargers for lithium batteries cut off in the range of 115 °F. In terms of discharge, lithium batteries perform well in elevated temperatures but at the cost of reduced longevity.

What temperature should a lithium battery be stored?

Proper storage of lithium batteries is crucial for preserving their performance and extending their lifespan. When not in use, experts recommend storing lithium batteries within a temperature range of -20 °C to 25 °C (-4 °F to 77 °F). Storing batteries within this range helps maintain their capacity and minimizes self-discharge rates.

How does temperature affect battery life?

High and low temperatures outside the ideal operating range not only have an impact on available capacity but also on the lifespan of the battery. Whereas low temperatures mostly result in reduced available capacity, high temperatures lead to battery degradation.

How fast does a battery change temperature?

Batteries possess significant thermal mass, meaning their internal temperature changes more slowly than the surrounding air temperature. For example, a large insulated battery bank might only experience a 10-degree temperature shift over 24 hours, even if the ambient temperature varies between 20 °C and 70 °C.

What temperature can a battery provide the most energy?

However, the temperature where the battery can provide most energy is around 45 °C. University research of a single cell shows the impact of temperature on available capacity of a battery in more detail. The below data is for a single 18650 cell with 1,5 Ah capacity and a nominal voltage of 3,7V (lower cut-off 3,2V and upper cut-off 4,2V).

Any battery running at an elevated temperature will exhibit loss of capacity faster than at room temperature. That's why, as with extremely cold temperatures, chargers for lithium batteries cut off in the range of 115 °F.
