

What is a lead-acid battery?

The lead-acid battery is a type of rechargeable battery first invented in 1859 by French physicist Gaston Planté. It is the first type of rechargeable battery ever created. Compared to modern rechargeable batteries, lead-acid batteries have relatively low energy density. Despite this, they are able to supply high surge currents.

What is a lead acid battery used for?

Lead-acid batteries were used to supply the filament (heater) voltage, with 2 V common in early vacuum tube (valve) radio receivers. Portable batteries for miners' cap headlamps typically have two or three cells. Lead-acid batteries designed for starting automotive engines are not designed for deep discharge.

How do you prevent sulfation in a lead acid battery?

Sulfation prevention remains the best course of action, by periodically fully charging the lead-acid batteries. A typical lead-acid battery contains a mixture with varying concentrations of water and acid.

When was a lead-acid battery invented?

The lead-acid battery was the first rechargeable battery invented back in 1859 by Gaston Plante, who experimented with lead plates in an acidic solution and found that the flow and storage of electric current could be reversed. A lead-acid battery has to be big enough to provide enough charge to start a car.

How long does a lead battery last?

Even more than 150 years later, the lead battery is still one of the most important and widely used battery technologies. Lead-acid batteries are known for their long service life. For example, a lead-acid battery used as a storage battery can last between 5 and 15 years, depending on its quality and usage.

What is a lead battery made of?

Utilizing lead alloy ingots and lead oxide, the lead battery is made of two chemically dissimilar lead-based plates immersed in a solution of sulphuric acid. How do you maintain a lead-acid battery? Apply a fully saturated charge of 14 to 16 hours to keep lead acid in good condition.

Batteries that are too small or have a low capacity may not be able to handle the demands of your device, causing them to generate heat. ... If a lead acid battery heats up while charging, it can indicate a problem with the charging system or the battery itself. Overcharging can cause the battery to release hydrogen gas, which can be dangerous ...
