

How does a DC bus work?

All DC buses are supplied by a battery charger that will carry the normal loads and maintain a charge on the battery. Each bus has a battery that will supply the bus in the event of a loss of power to the charger or a failure of the charger.

What is a power substation DC system?

Power substation DC system consists of battery charger and battery. This is to verify the condition of battery and battery charger and commissioning of them. Following instruments will be used for testing: Multimeter. (Learn how to use it) Battery loading unit (Torkel-720 (Programma Make) or equivalent).

What is a battery inspection checklist?

This detailed Battery Inspection Checklist ensures battery performance and safety. This checklist, which includes both visual and technical inspections, assists in identifying difficulties with mounting, cables, electrolyte levels, & voltage to ensure proper battery function.

What are the requirements of a battery unit?

Battery Unit Mandatory Condition: The battery set should have been properly charged as per the commissioning instructions of the battery manufacturer for the duration specified. Visual Inspection: Cleanliness of battery is checked and the electrolyte level checked as specified on the individual cells.

What is a battery inspection?

Last Fitment Date: Mention the date that the battery was last installed in the machine. The first level of inspection involves a thorough visual examination of the battery's physical condition. This step checks for any mechanical or structural faults that could hinder performance.

How to test a battery?

Visual Inspection: Cleanliness of battery is checked and the electrolyte level checked as specified on the individual cells. The tightness of cell connections on individual terminals should be ensured. The load current, minimum voltage of battery system, ampere-hour, duration etc., is preset in the test equipment using the keypad.
