

What is the difference between voltage and current in a battery?

The voltage of a battery is synonymous with its electromotive force, or emf. This force is responsible for the flow of charge through the circuit, known as the electric current. battery: A device that produces electricity by a chemical reaction between two substances. current: The time rate of flow of electric charge.

What are the components of a battery?

There are three main components of a battery: two terminals made of different chemicals (typically metals), the anode and the cathode; and the electrolyte, which separates these terminals. The electrolyte is a chemical medium that allows the flow of electrical charge between the cathode and anode.

Why is current the same on both sides of a battery?

In a battery, current is the same on both sides because it forms a closed circuit. The battery's internal chemical energy converts to electrical energy, generating a voltage difference between terminals. This voltage difference drives current through the circuit, from one terminal to another, and back through the battery.

What is a component in a circuit?

component A part of a circuit, e.g. a battery, motor, lamp, switch or wire. circuit An electrical circuit is made up of components, which are connected together using wires. Individual circuit components are represented using circuit symbols. current (I) Current is a flow of charges.

What happens when a battery is connected to a circuit?

When a battery is connected to a circuit, the electrons from the anode travel through the circuit toward the cathode in a direct circuit. The voltage of a battery is synonymous with its electromotive force, or emf. This force is responsible for the flow of charge through the circuit, known as the electric current.

How does voltage affect a battery?

This voltage difference drives current through the circuit, from one terminal to another, and back through the battery. As the current flows, the same amount of charge passes through both sides of the battery, ensuring equal current on both sides.
