Chemical energy is energy that is stored within chemical compounds, such as within the bonds of atoms and molecules. It's a form of potential energy that you won't observe until a chemical reaction occurs. Chemical energy can be changed into other forms of energy through chemical reactions or chemical changes. Energy, often in the form of heat, is absorbed ...

Thermal energy storage (TES) systems can store heat or cold to be used later, at different temperature, place, or power. The main use of TES is to overcome the mismatch between energy generation and energy use (Mehling and Cabeza, 2008, Dincer and Rosen, 2002, Cabeza, 2012, Alva et al., 2018). The mismatch can be in time, temperature, power, or ...

In the past few decades, electricity production depended on fossil fuels due to their reliability and efficiency [1]. Fossil fuels have many effects on the environment and directly affect the economy as their prices increase continuously due to their consumption which is assumed to double in 2050 and three times by 2100 [6] g. 1 shows the current global ...

Phase change materials (PCM) are well known in thermal energy storage (TES) applications [1], [2], [3]. PCMs are used to store energy when it is available, absorbing it and releasing it when needed. The most important requirements to be a good PCM may be divided in physical, chemical or economical requirements:
