

What is a capacitor compensation cabinet?

Generally speaking, capacitor compensation cabinets are installed in the power distribution room to improve the power factor. The contactor that controls the on and off of the capacitor is called the capacitor switching contactor, which is similar to the conventional contactor. However, there are some differences between them.

Which contactors are suited for capacitor bank switching?

Application The A... and AF... contactors are suited for capacitor bank switching for the peak current and power values in the table below. The capacitors must be discharged (maximum residual voltage at terminals < 50 V) before being re-energized when the contactors are making.

What is a capacitor contactor?

The contactors for capacitor switching are actually composed of a conventional contactor as well as extra auxiliary contacts and wires (resistance wires). The main function of the capacitor contactor lies in the auxiliary contact, which is very different from the conventional contact.

What is a power factor correction capacitor?

Power factor correction capacitors act as reactive power generators. By providing the reactive power, they reduce the total amount of current your system must draw from the utility-- see Figure 1. 3.6 A Note: Current into motor does not change. Figure 1. Power factor improvement

How much power can a capacitor have?

Taking into account the manufacturing tolerances, the exact power of a capacitor can reach 1.15 times its nominal power. Standard IEC 60831-1 Edition 2002 specifies that the capacitor must therefore have a maximum thermal current I_T of: $I_T = 1.3 \times 1.15 \times I_n = 1.5 \times I_n$ Consequences for the Contactors

How capacitors are precharged during pick-up?

. Technical Data) Main circuit: The capacitors are precharged during pick-up via early-make contacts and integrated pre-charge resistors before the main contacts close. This combination may be used for switching of individual capacitor for power factor correction of single loads or for switching capacitor banks in parallel in centralized groups
