

Does hydrogen energy have a battery supply chain

Can a hydrogen supply chain make hydrogen a key energy carrier?

To realize a hydrogen economy in the future, it is essential to construct a comprehensive hydrogen supply chain that can make hydrogen a key energy carrier. This paper reviews the various technologies involved in the hydrogen supply chain, encompassing hydrogen production, storage, transportation, and utilization technologies.

How does hydrogen supply chain work?

Hydrogen can help decarbonize the transportation and industrial sectors, while providing added flexibility to the power sector. Therefore, hydrogen supply chain models can receive exogenous demand from other industries or be optimized using an integrated approach to allow additional endogenous demand requirements.

Why is hydrogen supply chain planning important?

Correct hydrogen supply chain (HSC) planning is therefore vital to enable a sustainable transition, in particular when hydrogen is produced by water electrolysis using electricity from renewable sources (renewable hydrogen). However, due to the operational characteristics of the renewable HSC, its planning is complicated.

What technologies are important for a hydrogen supply chain?

This paper reviews the key technologies of hydrogen production, hydrogen storage, hydrogen transportation and delivery, and hydrogen utilization, which are important for the hydrogen supply chain. The challenges of constructing a hydrogen supply chain are also discussed.

Is hydrogen a future energy carrier?

Hydrogen is a widely acknowledged future energy carrier because of its nonpolluting properties and high energy density. To realize a hydrogen economy in the future, it is essential to construct a comprehensive hydrogen supply chain that can make hydrogen a key energy carrier.

What is a hydrogen supply chain (HSC)?

Usually, hydrogen supply chains (HSC) capture the entire supply chain from production to consumption [10,11,12]. HSCs are characterized by high heterogeneity. Production in HSCs can either occur using renewable or non-renewable energy.
