However, charging of EV requires electrical energy which can be produced from renewable energy sources such as solar, wind, hydroelectricity based power plants (Kiehne, 2003). The EV includes battery EVs (BEV), HEVs, plug-in HEVs (PHEV), and fuel cell EVs (FCEV). The main issue is the cost of energy sources in electric vehicles.

The ability to store energy can facilitate the integration of clean energy and renewable energy into power grids and real-world, everyday use. For example, electricity storage through batteries powers electric vehicles, while large-scale energy storage systems help utilities meet electricity demand during periods when renewable energy resources are not producing ...

Electric energy storage systems (EESs) can compensate for the sudden drops in the production from RES demonstrating a 40 % energy saving than fossil fuel thanks to their fast time response [7], [8]; moreover, the extension of electricity storage shows a reduction up to 44 % of the required renewable capacity to meet a sustainability target [9].

Water tanks in buildings are simple examples of thermal energy storage systems. On a much grander scale, Finnish energy company Vantaa is building what it says will be the world's largest thermal energy storage ...

Fig. 13 (a) [96] illustrates a pure electric vehicle with a battery and supercapacitor as the driving energy sources, where the battery functions as the main energy source for pulling the vehicle on the road, while the supercapacitor, acts as an auxiliary energy source for driving the vehicle on the road, also recovers a portion of the regenerative energy when the vehicle is ...
