What is thermal energy storage (TES)?

Thermal energy storage (TES) using chilled water is a popular solution for facilities across the globe because of low operating and maintenance costs as well as minimal complexity. As long as there is enough space to accommodate the sizeable tanks, any building can use this method. The operation of the TES system is inherently efficient.

How do TES tank designers determine the optimal design & operating conditions?

The evaluation of the weather data and the required daily cooling load enables TES tank designers to determine the optimal design and operating conditions. The cooling capacity and dimensions of the TES tank, among other factors, are defined in order to satisfy the highest cooling demand.

How hot does a PCM tank get?

Finally, by 284 min, there's a notable drop in the tank's surface temperature between 9.0°C and 12°C , specifically in the middle, likely due to the continued absorption of heat, top and bottom reached between 15.3°C and 13.3°C , suggesting the PCM has almost fully solidified.

What is COMSOL simulation of hydrogen storage in a cylindrical tank?

COMSOL simulation of hydrogen storage in a cylindrical tank: (a) 2D Axis-Symmetric Domain Meshing, (b) Surface Temperature Distribution, (c) Internal Hydrogen Velocity. For comparison with results found in experimental studies, the shape was kept cylindrical and LaNi₅ was chosen to represent the metal in the simulation.

How does PCM affect thermal energy density?

Furthermore, the application of PCM during charging in 7 h and discharging in 4.9 h moderated the thermal energy density changes to -3.73 kWh/m^2 and 2.83 kWh/m^2 , respectively. The rich dataset derived from the physical simulations and experimental validations was employed to train a Feed Forward Neural Network (FFNN) model.

How to reduce absorption time in a heat exchanger?

It confirms that improving the effective thermal conductivity of the hydride bed, increasing the heat transfer fluid flow rate, and reducing the contact conductance between the hydride bed and the tube wall of the heat exchanger are the most effective methods for reducing absorption time.
