Can a portable equipment operate from a battery pack or external power source?

Portable equipment that can operate from a battery pack or an external power source (such as a wall-adaptor or external supply) needs to be able to smoothly switch between the two power sources. This application note describes a circuit (Figure 1) that switches power sources with good efficiency and without switching noise. Figure 1.

How does a 12V battery backup power supply work?

In this tutorial, we are making a circuit of a 12V Battery Backup Power Supply. This circuit will automatically shift the load to the battery in the absence of the main supply. When the mains supply is back the load will shift to the mains supply and the battery will go into charging mode automatically.

What are the components of a switching circuit?

In this switching circuit, the source of power supply to a load circuit is changed between the battery and DC power. The main components that play important roles in the functioning of this circuit are the relay, switching transistors, and zener diode. In this circuit, three relays are used.

How to charge ESP32 board without a battery?

If you don't want to power the circuit using Battery, you can use the DC Power Adapter or 9V Battery. You may check the 5V 3A USB Charger circuit. The ESP32 Board operates between 2.2V to 3.6V. But we supply 5V from Micro-USB port. For 3.3V there is already an LDO voltage regulator to keep the voltage steady at 3.3V.

How does a microprocessor-supervisory circuit work?

The microprocessor-supervisory circuit (U1 in Figure 1) acts as a wall-source detector and debouncer. It monitors the wall supply and switches from battery power to the wall supply only when the wall supply is stable and has been at or above U1's trip voltage for a period of time.

How do I change the power supply voltage?

Connect an adjustable power supply. Set the voltage of the adjustable power supply to 14.4V. Remove the battery and the transformer and connect the power supply in the place of the battery. Adjust the 10K variable resistor until the LED glows. Connect your battery and the transformer back to where they were and remove the adjustable power supply.
