What is the most expensive battery metal in 2021?

Cobalt was by far the most expensive battery metal until late 2021, which was when lithium prices hit an inflection point, heading towards all-time highs. A single tonne of lithium carbonate, one of the refined forms of lithium that's used in batteries, now costs over \$80,000, up from around \$6,500 at the beginning of 2021.

How much does a titanium alloy cost?

As at now, some of the most popular titanium alloys include Ti-6Al-4V, Ti-6Al-2Sn-4Zr-2Mo and Ti Grade 5. Usually, the cost range of Ti-6Al-4V (also known as Grade 5) is between \$30 - \$40/kg because it possesses an excellent strength-to-weight ratio which makes it suitable for both aerospace and medical applications.

Why is Titanium so expensive?

Considering its availability as one of the main factors keeping its price in check, titanium is rather expensive when compared to other metals because it is also less abundant. It also has a high price for processing, as it is usually found in combination with other elements.

What factors determine the price per kilogram of titanium?

Several critical factors determine the price per kilogram of titanium, among them the production cost. The Kroll process, which is a time-consuming and energy-intensive method of extracting raw materials from titanium dioxide involves chlorination and magnesia reduction.

After printing, titanium parts often require post-processing steps, such as heat treatment, stress relief, and surface finishing, to meet specific quality standards. These processes can add to the overall cost. Estimating the Cost ...
