

# How to connect the capacitor of circulating fan

How do you replace a capacitor on a ceiling fan?

Replace a new capacitor by connecting the Red (live) wire (from ceiling fan) to the first terminal of capacitor and connect the blue wire to the second terminal of capacitor. Connect the red and blue wire and put a wire nut and electric tap and insert it in the wire connector as shown in fig below.

Where does a yellow capacitor wire go on a ceiling fan?

Yellow capacitor wire (6 $\mu$ F,200V) goes to switch terminal 1. The figure below illustrates the connection clearly: The ceiling fan has two windings,one that is running and one that is commencing. The capacitor must be connected in series with the starting winding and then across the power supply.

How does a 3-speed fan capacitor work?

The capacitor is utilized to not only start but also spin the fan. Simply put,the capacitor generates a magnetic flux (torque) that causes the fan to rotate. The wiring diagrams for 3-speed fan capacitors provide a clear roadmap for fan installation and control.

What is a capacitor in a fan?

The switch housing inside a fan has a black box which is a capacitor. This is a key component of the fan that allows it to function properly. The capacitor is utilized to not only start but also spin the fan. Simply put,the capacitor generates a magnetic flux (torque) that causes the fan to rotate.

What wire goes into a ceiling fan?

Blue capacitor wire(3 $\mu$ F,350V) goes into the motor housing. Red capacitor wire (3.5 $\mu$ F,200V) goes to switch terminal 3. Yellow capacitor wire (6 $\mu$ F,200V) goes to switch terminal 1. The figure below illustrates the connection clearly: The ceiling fan has two windings,one that is running and one that is commencing.

Can a 3.5 F capacitor be used in a ceiling fan?

Using a 3.5  $\mu$ F (microfarad) capacitor in a ceiling fan depends on the specific requirements of your ceiling fan's motor and its design. The capacitor in a ceiling fan is typically used for speed control,and different fans may require capacitors with varying capacitance values to achieve different speeds.

Replace a new capacitor by connecting the Red (live) wire (from ceiling fan) to the first terminal of capacitor and connect the blue wire to the second terminal of capacitor.

The capacitor wire connects the capacitor to the motor, providing the necessary electrical energy for the motor to start and run at different speeds. Understanding the Wiring Diagram of a 3 ...
