I have a small solar system designed for short term outages and potential earthquake emergencies. It consists of a couple of panels, a controller, a "control panel" that I wired for my use, some small 12 volt battery chargers for 18650 batteries, outputs for a ham radio, some 12 volt storage batteries and an inverter.

A charge controller regulates the voltage and current from the solar panels to the batteries. It prevents overcharging, ensuring the longevity of your battery. Batteries store excess energy generated by the solar panels. Connecting two batteries increases your storage capacity, providing more power during low sunlight conditions. Inverter

If the battery capacity is large, a higher current controller is required to ensure that the battery can be fully charged when the solar panel outputs sufficient power. For example, if your battery capacity is 200Ah and ...
