## Illustration of the principle of lead-acid battery quality change

What happens when a lead acid battery is charged?

Normally, as the lead-acid batteries discharge, lead sulfate crystals are formed on the plates. Then during charging, a reversed electrochemical reaction takes place to decompose lead sulfate back to lead on the negative electrode and lead oxide on the positive electrode.

#### How to recharge a lead acid battery?

Terminals: Connect the battery to the external circuit. Figure 1: Lead Acid Battery. The battery cells in which the chemical action taking place is reversible are known as the lead acid battery cells. So it is possible to recharge a lead acid battery cell if it is in the discharged state.

#### What are the properties of lead acid batteries?

One of the most important properties of lead-acid batteries is the capacity or the amount of energy stored in a battery (Ah). This is an important property for batteries used in stationary applications, for example, in photovoltaic systems as well as for automotive applications as the main power supply.

#### What are the applications of lead - acid batteries?

Following are some of the important applications of lead - acid batteries : As standby units in the distribution network. In the Uninterrupted Power Supplies (UPS). In the telephone system. In the railway signaling. In the battery operated vehicles. In the automobiles for starting and lighting.

Why is the discharge state more stable for lead-acid batteries?

The discharge state is more stable for lead-acid batteries because lead,on the negative electrode,and lead dioxide on the positive are unstable in sulfuric acid. Therefore,the chemical (not electrochemical) decomposition of lead and lead dioxide in sulfuric acid will proceed even without a load between the electrodes.

#### How much lead does a battery use?

Batteries use 85% of the lead produced worldwide and recycled lead represents 60% of total lead production. Lead-acid batteries are easily broken so that lead-containing components may be separated from plastic containers and acid, all of which can be recovered.
