How much energy does a rechargeable lithium-oxygen battery produce?

Rechargeable lithium-oxygen (Li-O 2) batteries boast a satisfactory theoretical energy density (11,400 Wh kg -1,based on pure lithium),nearly equivalent to gasoline (12,800 Wh kg -1); the actual energy density also approaches that of gasoline, at approximately 1700 Wh kg -1.

What is the reversible capacity of a lithium-oxygen battery?

This design delivered a reversible capacity of 1000 mAh g -1and sustained 900 cycles with reduced polarization. The future development of lithium-oxygen batteries will require the synergistic integration of multiple technological elements to achieve overall performance enhancement (Figure 9 i).

Lithium-oxygen batteries (LOBs), despite high-energy densities, generally suffer from poor cycling performances, which put severe constraints on their commercialization. Herein, we demonstrate a cathode catalyst featuring a hollow structure with high-density, low-coordinated Ru active sites. The high-density low-coordinated Ru active sites could efficiently ...

Lithium-oxygen (Li-O 2) batteries have great potential for applications in electric devices and vehicles due to their high theoretical energy density of 3500 Wh kg -1.Unfortunately, their practical use is seriously limited by the sluggish decomposition of insulating Li 2 O 2, leading to high OER overpotentials and the decomposition of cathodes and electrolytes.

Theoretically with unlimited oxygen, the capacity of the battery is limited by the amount of lithium metal present in the anode. The theoretical specific energy of the Li-oxygen cell, as shown with the above reactions, is 11.4 kWh/kg (excluding the weight of oxygen), the highest for a metal air battery. In addition to this very high specific energy, the lithium-air battery offers a high ...

However, there have been no reports of a battery based on lithium superoxide (LiO2), despite much research into the lithium-oxygen (Li-O2) battery because of its potential high energy density. Several studies of Li-O2 batteries have found evidence of LiO2 being formed as one component of the discharge product along with lithium peroxide (Li2O2).
