

What is a high-voltage multi-channel battery monitoring structure?

The proposed high-voltage multi-channel battery monitoring structure supports 16-cell multiplexing, the selection of six auxiliary low-voltage channels, and shares an incremental sigma-delta ADC to achieve monitoring. The difference calibration method under the control of the digital module further improves the monitoring consistency and accuracy.

What is a high-precision multi-channel battery monitoring integrated circuit (BMIC)?

High-precision multi-channel battery monitoring integrated circuits (BMICs) assist battery management systems (BMSs) in effectively managing battery data, which is the key to improving the reliability of electric vehicles (EVs).

What is battery management system (BMS)?

1. Introduction Battery management systems (BMSs) are widely used in electric vehicles (EVs), energy storage, and high-power portable equipment, and are the control core of the energy supply system.

What is a battery monitoring chip?

A structurally complete battery monitoring chip design is presented in Ref. , which supports seven-cell series battery stack monitoring and has two additional temperature monitoring channels. A 12-bit SAR ADC was designed to achieve a measured accuracy of  $\pm 7$  mV.

What does a battery control unit do?

The main control unit is primarily responsible for estimating battery data, such as the state of charge (SOC), state of health (SOH), state of power (SOP), and the implementation of system management tasks, including battery energy management, thermal management, management of high voltage, and contactor protection.

What is a battery monitoring and management chip (BMIC)?

The key to ensuring the performance and reliability of energy vehicles is the BMS, in which BMIC is responsible for accurately monitoring various battery cell data. A 16-cell stackable battery monitoring and management chip using 0.18  $\mu$ m high-voltage BCD technology was designed in this study.
