To improve the energy density of supercapacitors, nickel-cobalt electrode materials have been widely studied due to their advantages of high energy density, high safety and long life.

Typically, a Ni-MH battery is made of positive electrode (nickel hydroxide) and negative electrode (a metal alloy containing different rare earth elements and nickel called as Mischmetal). It is estimated that 200 million waste Ni-MH batteries are discarded annually from which 1965 tons of nickel and 337 tons of cobalt can be recovered every year (Jiang et al., 2015).

A cobalt-free (Co-free) RE 0.9 Mg 0.1 Ni 3.9 Al 0.2 alloy (RE: rare earth) was prepared for use in a nickel-metal hydride (Ni-MH) battery. The use of the alloy as the negative electrode of the Ni-MH battery effectively improved the high-rate discharge and suppressed the self-discharge compared to the conventional AB 5-type alloy. Moreover, carbon-coated Ni(OH) ...
