

Do perovskite solar cells lose voltage?

To achieve highest performance for perovskite solar cells (PSCs), various interlinked open-circuit voltage losses need to be mitigated. [41 - 43] However, to date, a comprehensive study that analyses the voltage losses of solution-processed perovskite thin films over micrometer-sized pyramidal textures is missing.

Do narrow-bandgap perovskite solar cells lose VOC?

Narrow-bandgap (NBG) perovskite solar cells based on tin-lead mixed perovskite absorbers suffer from significant open-circuit voltage (VOC) losses due primarily to a high defect density and charge carrier recombination at the device interfaces. In this study, the VOC losses in NBG perovskite single junction cells ($E_g = 1.21$ eV) are addressed.

How to improve the efficiency of perovskite solar cells?

Increasing the open-circuit voltage (V_{oc}) is one of the key strategies for further improvement of the efficiency of perovskite solar cells. It requires fundamental understanding of the complex optoelectronic processes related to charge carrier generation, transport, extraction, and their loss mechanisms inside a device upon illumination.

Do perovskite films have high voltage losses?

Although the thorough surface coverage condition is fulfilled when using high concentration solution, we note that the perovskite films still suffer from high voltage losses at the perovskite/ETL interface.

What are the VOC losses in NBG perovskite single junction cells?

In this study, the VOC losses in NBG perovskite single junction cells ($E_g = 1.21$ eV) are addressed. The optimized NBG subcell is then used to fabricate highly efficient all-perovskite tandem solar cells (TSCs).

What causes VOC losses in methylammonium lead iodide perovskite-based solar cells?

Herein, we report the important origin of V_{oc} losses in methylammonium lead iodide perovskite (MAPI)-based solar cells, which results from undesirable positive charge (hole) accumulation at the interface between the perovskite photoactive layer and the poly (3,4-ethylenedioxythiophene):poly (styrenesulfonate) (PEDOT:PSS) hole-transport layer.

Although the impact of loss mechanisms on performance of thin film GaAs solar cells has been discussed by Xufeng Wang et al. in this literature [16], the impact on that of perovskite solar cells is rarely reported. Recently, the efficiency gains of perovskite solar cells are correlated with increasing open-circuit voltage (V_{oc}) by enhancing the photon recycling effect ...

Perovskite solar cells (PSCs) have made incredibly fast progress in the past years, with the efficiency approaching 26%, which is comparable to those of the best silicon solar cells. One of the features of ...

Solar power promises to cover half of the worldwide electricity production by 2060 [1]. As a third-generation photovoltaic technology, perovskite solar cells (PSCs) are pivotal in this transformation, owing to their low manufacturing costs and high efficiency of over 26 % [2]. The commercialization of the current generation of PSCs is hindered due to various ...

However, wide-bandgap perovskite cells are usually affected by voltage loss. This issue hinders the development of perovskite-organic tandem solar cells, and thus needs to be tackled. The solution

However, the energy-level mismatch between functional layers and tremendous trap states in perovskite films make it challenging to reduce the high open-circuit voltage (V_{oc}) loss in Sn-Pb binary perovskite solar cells (PSCs).

Open circuit voltage (V_{oc}) loss within perovskite solar cells (PSCs) is undesirable as it reduces the power conversion efficiency of these devices. This report ...
