## Sodium-ion lithium battery negative electrode materials

Which electrode materials are suitable for sodium ion batteries?

Sodium ion batteries mainly rely on the continuous detachment and insertion of sodium ions at the positive and negative electrodes. Thus, MOFs with porous structure, high specific surface area, and excellent conductivity are suitable as electrode materials for batteries.

Is TiO 2 a potential negative electrode material for sodium ion batteries?

Due to the similar (but not identical) chemistry between lithium and sodium, TiO 2 is considered as an interesting potential negative electrode material for sodium ion batteries (SIBs) and is being investigated in fundamental studies for potential applications.

Is Ti a good electrode material for aqueous sodium ion batteries?

Ti substitution tunes the charge ordering property and reaction pathway, significantly smoothing the discharge/charge profiles and lowering the storage voltage. Both the fundamental understanding and practical demonstrations suggest that Na0.44 [Mn1-xTix]O2 is a promising negative electrode material for aqueous sodium-ion batteries.

Can aqueous sodium-ion batteries be used as a negative electrode?

Aqueous sodium-ion batteries could be a potential solution for large-scale energy storage, but the conventional negative electrodes are not efficient. Here, the authors report a titanium-substituted tunnel-type Na0.44MnO2material as a promising negative electrode for aqueous sodium-ion batteries.

Which materials are suitable for anode applications as sodium ion batteries (sibs)?

Hard carbon materials are the leading candidates for anode applications as sodium-ion batteries (SIBs) because of their unique properties. These materials are derived through O 2 -diverting precursors that are not able to transform into graphite, even at high carbonization temperatures .

What materials are used for negative electrodes?

Carbon materials, including graphite, hard carbon, soft carbon, graphene, and carbon nanotubes, are widely used as high-performance negative electrodes for sodium-ion and potassium-ion batteries (SIBs and PIBs).
