

Therefore, it becomes imperative that effective and economical methods of storing solar energy on a large scale are developed. Both sensible and latent heat storage methods are available. The use of a thermal energy storage (TES) system is an attractive choice for high-temperature applications such as power generation plants.

As shown in Fig. 1, the schematic design of regolith thermal storage power generation system mainly includes three parts: linear Fresnel collector, regolith thermal energy reservoir (TER) and Stirling power generator. In the lunar daytime, the solar energy is collected into CPC (Compound Parabolic Collector) by the linear Fresnel mirrors, then stored in the TER ...
