What is a sodium sulfur battery?

A sodium-sulfur (NaS) battery is a type of molten-salt battery that uses liquid sodium and liquid sulfur electrodes. This type of battery has a similar energy density to lithium-ion batteries, and is fabricated from inexpensive and low-toxicity materials.

What is the structure of a sodium-sulfur battery?

Structure of sodium-sulfur battery . Sodium ???-Alumina (beta double-prime alumina) is a fast ion conductor material and is used as a separator in several types of molten salt electrochemical cells. The primary disadvantage is the requirement for thermal management, which is necessary to maintain the ceramic separator and cell seal integrity.

What is a high temperature sodium sulfur battery?

High-temperature sodium-sulfur (HT Na-S) batteries were first developed for electric vehicle (EV) applications due to their high theoretical volumetric energy density. In 1968,Kummer et al. from Ford Motor Company first released the details of the HT Na-S battery system using a ??-alumina solid electrolyte .

How does a sodium-sulfur battery work?

The sodium-sulfur battery uses sulfur combined with sodium to reversibly charge and discharge, using sodium ions layered in aluminum oxide within the battery's core. The battery shows potential to store lots of energy in small space.

Are rechargeable room-temperature sodium-sulfur (na-S) batteries suitable for large-scale energy storage? Rechargeable room-temperature sodium-sulfur (Na-S) and sodium-selenium (Na-Se) batteries are gaining extensive attention for potential large-scale energy storage applicationsowing to their low cost and high theoretical energy density.

What is the largest sodium-sulfur battery?

The largest sodium-sulfur battery having a power of 9.6 MWand a capacity of 57.6 MWh was commissioned in 2004 for Hitachis automotive systems factory in Japan. Sodium-sulfur batteries are a commercial reality in Japan. The batteries require little maintenance and can be operated in remote sites.

Sodium metal, having specific capacity of 1166 mAh-g - 1 and redox potential of -2.71 V (vs. SHE), is a key contender in emerging high-energy systems like sodium-sulfur (Na-S) and sodium-air (Na-O) batteries. However, its high reactivity with organic electrolytes presents more challenges than Li metal.
