The concept of superconducting magnetic energy storage system

What is superconducting magnetic energy storage?

Superconducting magnetic energy storage is mainly divided into two categories: superconducting magnetic energy storage systems (SMES) and superconducting power storage systems (UPS). SMES interacts directly with the grid to store and release electrical energy for grid or other purposes.

What are the components of superconducting magnetic energy storage systems (SMEs)?

The main components of superconducting magnetic energy storage systems (SMES) include superconducting energy storage magnets, cryogenic systems, power electronic converter systems, and monitoring and protection systems.

What is a superconducting magnet?

Superconducting magnets are the core components of the systemand are able to store current as electromagnetic energy in a lossless manner. The system acts as a bridge between the superconducting magnet and the power grid and is responsible for energy exchange.

How does a superconductor store energy?

It stores energy in the magnetic fieldcreated by the flow of direct current (DC) power in a coil of superconducting material that has been cryogenically cooled. The stored energy can be released back to the network by discharging the coil.

Can superconducting magnetic energy storage (SMES) units improve power quality?

Furthermore, the study in presented an improved block-sparse adaptive Bayesian algorithm for completely controlling proportional-integral (PI) regulators in superconducting magnetic energy storage (SMES) devices. The results indicate that regulated SMES units can increase the power quality of wind farms.

What are superconductor materials?

Thus, the number of publications focusing on this topic keeps increasing with the rise of projects and funding. Superconductor materials are being envisaged for Superconducting Magnetic Energy Storage (SMES). It is among the most important energy storage systems particularly used in applications allowing to give stability to the electrical grids.

This storage system is known as Superconducting Magnetic Energy Storage (SMES) 2, 3. This rather simple concept was proposed by Ferrier in 1969 4. The magnetic stored energy (W mag) is determined by a coil's self inductance (L) and its current (I) or, equivalently, by the magnetic flux density and field integrated over all space (Fig. 9.1): [9.1] W mag = $1 \ 2 \ L \dots$
