These include solid state batteries, nanostructured electrodes, [52] sodium ion batteries, [53] lithium sulfur batteries [54] and binder-less cathodes. [55] Some of these are more problematic than others, for example all solid state batteries (ASSBs) employ lithium anodes, which have adhesive properties that make traditional cutting methods challenging.

The key elements of this policy framework are: a) encouragement of manufacturers to design batteries for easy disassembly; b) obligation of manufacturers to provide the technical information necessary for EOL battery ...

In this work, the LFP cathode materials of spent power batteries were collected from a local lithium-ion battery company (CATL Co., Ltd., Ningde, Fujian, and P.R. China). The 160 Ah power batteries were cycled at a rate of 0.5 C (80 A) for 800 cycles in the voltage window from 2.5 to 4.0 V. Then the faded LFP batteries were utilized.
