

What is a high-temperature capacitor?

High-temperature designs incorporate metals such as tin, palladium-silver and gold plating which have melting points well above the temperature rating of the capacitor. These materials perform well at elevated temperatures and should be considered a critical part of the construction in such a demanding environment.

What type of capacitor is used in high temperature applications?

The supply of high-temperature ceramic capacitors for applications above 175 °C is highly fragmented, with many of the smaller, more specialized vendors of ceramic capacitors offering a variation on the high temperature ceramic capacitor. Tantalum - Certain types of tantalum capacitor designs are used in high temperature applications.

Can dielectric materials withstand high-temperature capacitors?

Various classes of dielectric materials have been developed for high-temperature capacitors, but each has its own limitations. Normally, ceramics can withstand high temperature and exhibit high  $\epsilon_r$ , but low breakdown strength ( $E_b$ ) and large variation of dielectric properties versus temperature limit their applications.

Are high-temperature capacitors reliable?

The lack of reliable high-temperature, high value capacitors has almost certainly limited growth in these newer applications. Most current capacitor technologies on the market, such as aluminium electrolytics or film capacitors, are limited to a maximum temperature range of 125°C - 150°C or even lower.

Why do I need a high temperature capacitor?

In this application high temperature capacitors are needed for the DC/DC converters used in drilling heads that experience rising ambient temperatures the deeper you drill.

What is the maximum temperature a capacitor can withstand?

Most current capacitor technologies on the market, such as aluminium electrolytics or film capacitors, are limited to a maximum temperature range of 125°C - 150°C or even lower. To achieve higher temperature ratings, ceramics and tantalum capacitors are used. In downhole electronics, high temperature is usually classified as 150°C and above.
