How do you recondition a battery?

Our top recommended method of reconditioning a battery is attaching a desulfator to the battery. Check out this battery desulfator article to see what exactly a battery desulfator does and how well it works. Let's firstly talk about sulfation (FYI, this can also be spelt sulphation). What is sulfation? All lead-acid batteries suffer from sulfation.

How to recondition a 12 volt car battery?

In essence, this means reviving and rejuvenating your 12 volt vehicle battery. How to do it? By reversing sulfation and acid stratification. These are the two major causes of battery decline and death. TLDR Section Our top recommended method of reconditioning a battery is attaching a desulfator to the battery.

Can desulfation recover a battery to health?

Yes, there are times that desulfation cannot recover a battery to health. If the battery has been unused for several months, or years and is very severely discharged, then sulfation will have had time to develop to a highly advanced state. That means the sulfate crystals will be extremely thick, hard and attached strongly to the battery plates.

What happens if you leave a battery unused?

1) Leaving the battery partially discharged. If you ever leave your battery unused for any length of time, this will increase the sulfation on your battery. The longer you leave it, the worse the sulfation will be. Charging the battery is what causes the lead sulfate to return to its original forms as lead and sulphuric acid.

Can a lead-acid battery be reconditioned?

There is also acid stratification, which can also be called acid layering. A well-rounded and full battery reconditioning process will also take action to fix this problem. If you remember, the electrolyte in a lead-acid battery is made from a mixture (or solution) of sulphuric acid and distilled water.

What happens when a device is connected to a battery?

When you connect a device to the battery, the negatively charged electrons move from the negative plate, through the device to the device's positive side, hence giving power to the device (the movement of electrons is what electricity is). This movement of electrons is called the flow of current, and is electricity in action.
