Is the behaviour of the laptop [losing work when power is suddenly removed] normal?

The behaviour of the laptop [losing work when power is suddenly removed] is normal. Was this reply helpful? There are no UPS and the time to power off is really short, a few seconds. One unit is a nettop with W8.1, basically a laptop. Just to be clear, the machines enter sleep BEFORE the power is cut in the test. Only the laptop loses work.

How do I fix a faulty AIO?

This is an AIO fix for issues where there is no physical damage, yet the unit won't power on and the power indicator flashes in a series. Without Opening: Unplug everything from the PC. Including the battery if applicable. Hold down the power button for 30 seconds. If it boots, it's all good and you can skip the rest of this.

Should I unplug a gas hob if power goes out?

Unplug appliances that were on before the power went out if you don't want them to spring back to life when power is restored. If you have a gas hob, you can use it as usual.

In many of the older machines (not sure on brand new ones) they have a back up battery in the electrical cabinet to back up control memory. I have seen several times when they sell a used machine and disconnect the machine for a while and the battery dies and the memory is lost and they need to re-load the parameters let alone part programs.

What to do if the all-in-one machine battery is out of power

A single solar panel can run it or a small inverter connected to a 100ah battery. On the other hand, older less efficient models use 1500 to 3000 watts. Check the UL label on your washing machine to find out how much power it uses. The power usage stated on ...

I have a HP Pavilion All-In-One desktop, model no. MS219 running Win 10 OS. I push the start button and the power light on the front blinks but the computer won't start. The power light on the back is on, indicating there is power to the computer.
