This small cap can be charged up and then slowly dissipated running an entire system for hours. Combine two in series for 5F/5V.

Replacing a capacitor with something that has a higher voltage rating is always safe. The only problem there is that a capacitor rated for a higher voltage is often physically larger, everything else being equal. Make sure they actually fit in the same space. Sometimes it is also safe to use capacitors with a larger capacitance (Farads).

You can buy a new capacitor with the correct specs for the fan and replace it. I did that on a ceiling fan that died shortly after I moved into my house and it's been running great ever since. Much cheaper than replacing the fan itself. Edit: If you happen to have access to a multimeter, there's plenty of videos on that will explain how ...
