What is the working principle of a solar cell?

**Working Principle:** The solar cell working principle involves converting light energy into electrical energy by separating light-induced charge carriers within a semiconductor. **Role of Semiconductors:** Semiconductors like silicon are crucial because their properties can be modified to create free electrons or holes that carry electric current.

What is the working principle of a photovoltaic cell?

**Working principle of Photovoltaic Cell** is similar to that of a diode. In PV cell, when light whose energy ( $h\nu$ ) is greater than the band gap of the semiconductor used, the light gets trapped and used to produce current.

How do solar cells work?

**Working Principle:** The working of solar cells involves light photons creating electron-hole pairs at the p-n junction, generating a voltage capable of driving a current across a connected load.

What is a solar cell & a photovoltaic cell?

**Solar Cell Definition:** A solar cell (also known as a photovoltaic cell) is an electrical device that transforms light energy directly into electrical energy using the photovoltaic effect.

How does a photovoltaic cell work?

The working principle of a photovoltaic (PV) cell involves the conversion of sunlight into electricity through the photovoltaic effect. Here's how it works: **Absorption of Sunlight:** When sunlight (which consists of photons) strikes the surface of the PV cell, it penetrates into the semiconductor material (usually silicon) of the cell.

What is a solar cell?

A solar cell (also known as a photovoltaic cell or PV cell) is defined as an electrical device that converts light energy into electrical energy through the photovoltaic effect. A solar cell is basically a p-n junction diode.
