

Can cellulose be used as a conductive substrate?

More recently, Cheng et al. synthesized O - (2,3-Dihydroxypropyl) cellulose (DHPC) and applied it as a substrate to realize an efficient flexible OPV with a PCE of 4.98% ; meanwhile, Ma et al. utilized the cellulose-based conductive substrate to fabricate a perovskite solar cell that delivered a PCE of 4.49% .

What is CNF-based conductive substrate?

An eco-friendly cellulose nanofibers (CNF)-based conductive substrate is developed. This CNF-based conductive substrate shows high transparency and flexibility. This conductive substrate possesses excellent adhesion of silver nanowires. A flexible organic solar cell using this electrode delivers a high PCE of 7.47%.

Can cellulose nanofibers be used as a conductive substrate?

Herein, a highly transparent and flexible conductive substrate based on eco-friendly cellulose nanofibers (CNFs) is successfully developed by embedding silver nanowires (Ag NWs) into the TEMPO-oxidized CNFs (TOCN) through a facile, printable transfer method.

What are the mechanical properties of flexible conductive substrates?

In addition to having acceptable conductivity and optical transparency, possessing decent mechanical strength and stability are also the critical requirements for the flexible conductive substrates. The mechanical properties of these substrates were first examined and Fig. 3 displayed their corresponding stress-strain curves.

Why do conductive substrates have a high FOM value?

Such high FoM value of the TOCN/AgNWs substrate can be ascribed to the nano-size fibers of TOCN which not only allows high portion of visible light to pass through but also enables homogeneous hybrid with AgNWs. The thermal properties of these studied conductive substrates were next investigated.

How flexible are organic solar cells (OSCs)?

Use the link below to share a full-text version of this article with your friends and colleagues. Flexibility is a key advantage of organic solar cells (OSCs), and the power conversion efficiencies (PCEs) of flexible OSCs (FOSCs) are primarily constrained by flexible transparent electrodes (FTEs).

Flexible organic solar cells (OSCs), especially ultra-flexible OSCs, show great potential for applications in wearable devices and related fields. ... polymer network within an ethyl cellulose (EC) film. OSCs fabricated ...

solar cells have been carried out on the interfacial modification, 6,7 perovskite materials, 8-10 stability, 11 etc. Improving the optical characteristics of the front electrode plays an important ...

In addition, the metal substrate is electrically conductive, and the monolithic integration of solar cell requires

an insulating layer between the substrate and electrode. ...

Using pFBPA as an additive for solution-processed perovskites significantly suppresses non-radiative recombination. However, it simultaneously deteriorates the film ...

Flexible solar cells, with the merits of structure compactness and shape transformation, are promising power sources for future electronic devices. However, frangible indium tin oxide-based transparent conductive substrates ...

Perovskite/perovskite tandem solar cells have recently exceeded the record power conversion efficiency (PCE) of single-junction perovskite solar cells. They are typically built in the superstrate configuration, in which the device is ...

This review comprehensively highlights recent advancements in the design and fabrication of FOSCs and SOSCs, with a particular emphasis on key functional layers, ...

The highly conductive and flexible nickel-polyethylene terephthalate (Ni-PET) substrate was prepared by a facile way including electrodeposition and hot-press transferring. ...

Dye-sensitized solar cells (DSSCs) stacked in third-generation photovoltaic cells got tremendous limelight for having simple, efficient and economical prospects. ... Preparation ...

The structure of a dye sensitized solar cell mainly consists of three major components, namely: the working electrode which is usually a dye molecule coated ...

However, frangible indium tin oxide-based transparent conductive substrates severely limit the flexibility of solar cells. Herein, we develop a flexible transparent conductive ...

Transparent conducting oxides (TCOs) are wide bandgap semiconductors ($E_g \geq 3.1$ eV) that have high transmission of light in the visible and near-infrared regions, high ...

Research into dye-sensitized solar cells: a review highlighting progress in India, S Bera, D Sengupta, S Roy, K Mukherjee. Skip to content ... fluorine-doped tin oxide (FTO), ...

The most used ceramic substrate for solar cells is the glass substrate. Glass substrate shows good thermal stability and is resistant to chemical and moisture attacks. ... In ...

Here we report for the first time a monolithic perovskite-CIGS tandem (CIGS = $\text{Cu}(\text{In,Ga})\text{Se}_2$) solar cell on a flexible conductive steel substrate with an efficiency of 18.1%, the highest for a flexible perovskite-CIGS tandem ...

In addition, these conductive cellulose films and some cellulose derivative have been studied as a substrate in fabrication of dye-sensitized solar cells. 17,21,22 There is little done in the area of ...
