

Can energy storage systems bridge the gap between high specific energy and power?

Researchers developing the next generation of energy storage systems are challenged to understand and analyze the different charge storage mechanisms, and subsequently use this understanding to design and control materials and devices that bridge the gap between high specific energy and power at a target cycle life.

How can a charge storage perspective be used to design electrochemical interfaces?

This perspective can be used as a guide to quantitatively disentangle and correctly identify charge storage mechanisms and to design electrochemical interfaces and materials with targeted performance metrics for a multitude of electrochemical devices.

How do chloroaluminate ionic liquids affect the rate of charge storage?

Xu et al. decreased the tortuosity and increased the porosity of graphite cathodes in aluminum batteries with chloroaluminate ionic liquids, yielding higher pseudocapacitive charge storage contributions and thus higher rate-capability. Ultimately, they reduced diffusion paths, and increased mass transport by migration.

Backflow vortices (BFV) and cavitation are the main sources of pressure fluctuations (PF) in pump-turbine (PT) transitions. However, their interaction mechanism and effect on the transitions of pumped-storage power systems remain unclear. In the present work, the guide vane closing process (GVCP) after the pump power-trip (PPT) of a pumped-storage power system was ...

Renewable energy generation can depend on factors like weather conditions and daylight hours. Long-duration energy storage technologies store excess power for long periods to even out the supply. In March 2024, the House of Lords Science and Technology Committee said increasing the UK's long-duration energy storage capacity would support the ...

Energy storage is the capture of energy produced at one time for use at a later time [1] to reduce imbalances between energy demand and energy production. A device that stores energy is ...

A Stored Energy Mechanism (SEM) is a mechanism that opens and closes a device (Switch) by compressing and releasing spring energy. The operating handle compresses a set of closing springs and a separate set of opening springs. These springs store the mechanical energy of this movement and are held in the compressed state by close and open latches.
