

How important is the density of charge-transfer States for organic solar cells?

Detailed knowledge about the density of charge-transfer states is necessary to understand the limitations and optimization potential of organic solar cells. In this Perspective, we will first highlight the importance of the density of CT states for the organic solar cell performance.

Do inorganic photovoltaics have a low static disorder?

We see that inorganic photovoltaics possess extremely low static disorder and exhibit much less energy loss. The large static (or structural) disorder and thermal disorder within Y-series OSCs are the potential limiting factors for a further improvement of device performance.

What are the characteristics of solar cell technology?

Any solar cell technology should excel in a number of characteristics, among them the capability to absorb photons and an efficient conversion into free charge carriers. (17) Typical organic semiconductors used in solar cells already exhibit a very high absorption coefficient.

Does a static temperature independent energetic disorder dominate the spectral line-width of emission?

In line with Burke's EQE measurements, the static temperature independent energetic disorder of their studied system (MeLPPP:PCBM60) was also concluded to dominate the spectral line-width of emission.

Does energetic CT disorder affect solar cell properties?

In this Perspective, we want to focus on energetic CT disorder, which can be separated into dynamic and static broadening. Both contributions uniquely affect the solar cell properties, and we will highlight current research results regarding their dominance over the CT state energy. CC-BY-NC-ND 4.0 .

How are current-voltage characteristics of solar devices measured?

The current-voltage characteristics of the devices were measured in a N₂-glovebox, at ambient temperature, using a Keithley 2602 source meter. To illuminate the device, a Sun 2000 solar simulator from ABET Technologies was used, which is calibrated for AM1.5 condition.

At the other hand, I_{o1} ($i=1$), and I_{o2} ($i=2$) are the dark saturation currents of the two diodes ($D1$ and $D2$), in the equivalent circuit as shown in figure 1./7,8/ Fig.1 Equivalent ...
