

Can Li-ion batteries be used in a photovoltaic power plant?

In this sense, this article analyzes the economic feasibility of a storage system using different Li-ion batteries applied to a real case of the photovoltaic power plant at Alto Rodrigues, Rio Grande do Norte, Brazil.

Are lithium ion batteries profitable?

Frequently using Li-ion (thus reducing lifetime) can be financially attractive. Using Li-ion is unprofitable unless it participates in grid services. Electrical energy storage (EES) such as lithium-ion (Li-ion) batteries can reduce curtailment of renewables, maximizing renewable utilization by storing surplus electricity.

Can Li-ion battery storage be financially attractive?

A novel cash flow model was created for Li-ion battery storage in an energy system. The financial study considers Li-ion battery degradation. Frequently using Li-ion (thus reducing lifetime) can be financially attractive. Using Li-ion is unprofitable unless it participates in grid services.

How to achieve the viability of the energy storage system?

According to the results, the viability of the energy storage system can be achieved in different ways. The first way would be to reduce current investment costs in storage systems. In the second way, the energy sale price is higher than the current sale price.

Is LIB better than LCOE for photovoltaic grid-connected systems?

A techno-economic comparison between LIB and LACs for photovoltaic grid-connected systems was conducted in Ref. [1], utilizing real commercial load profiles and resource data. The results indicated that the system employing LIB achieved a Levelized Cost of Energy (LCOE) of 0.32 EUR/kWh, compared to 0.34 EUR/kWh for the system with LACs.
