

The concept of sensible heat storage and latent heat storage

Are sensible and latent heat storage materials suitable for thermal energy storage?

It is worth noting that using sensible and latent heat storage materials (SHSMs and phase change materials (PCMs)) for thermal energy storage mechanisms can meet requirements such as thermal comfort in buildings when selected correctly.

What is latent heat storage (LHS) technology?

Due to its high thermal energy storage density and nearly constant working temperatures, latent heat storage (LHS) technology has become a good solution for correcting the mismatch between energy supply and demand.

What is sensible heat storage?

Sandip S. Deshmukh, in Journal of Energy Storage, 2022 Sensible heat storage is the process of storing energy by increasing the temperature of a medium having a high heat capacity, such as water or rock [66,67]. Sensible heat storage materials can be classified into two main types, as shown in Fig. 8. Fig. 8.

What is the difference between a sensible heat system and a latent heat system?

The system is bulky. Sensible heat systems may need much more storage medium than latent heat systems to store the same amount of energy. Concrete, for example, has a heat capacity of around 1 kJ/kg K, compared to the latent heat of calcium chloride, which may store or release 190 kJ/kg K during phase transition.

What are the advantages of sensible heat energy storage?

The advantages of sensible heat energy storage are low cost and simplicity. It utilizes the specific heat capacity of the medium to store heat, which makes the device bulky. Moreover, the temperature changes continuously during the heat storage and release process.

What is the difference between sensible and latent energy storage?

Sensible system shows an advantage with the wider temperature range. Latent system outperforms the sensible one in the narrow ranges of operation. To show the difference in energy storage capacity between sensible and latent storage. Two storage media are chosen; water as a sensible medium, and lauric acid as a latent medium.
